

Mildew / Algae Resistance

Outdoor resistance and routine cleaning guidance for DeckRite PVC membrane surfaces

WHY THIS MATTERS

DeckRite membranes are designed for outdoor use and are formulated to withstand exposure to the elements. The membrane contains a fungicide used in vinyl membranes to help prevent surface penetration of algae and/or mildew spores.

PERIODIC CLEANING PROCEDURE

1	CLEAN PERIODICALLY Dirt and debris on the membrane surface can support mildew or algae growth, so clean the surface periodically.
2	USE MILD SOAP & WATER Apply mild liquid dish soap with water and clean the surface using a soft-bristled scrub brush.
3	RINSE THOROUGHLY Rinse the membrane thoroughly with clean water after cleaning.

MEMBRANE RESISTANCE

The formulation is intended to prevent surface penetration of algae and/or mildew spores and provide years of service.

SURFACE LIMITATION

The formulation does not, and cannot, prevent mildew or algae from growing in dirt and debris on the surface of the membrane.

IMPORTANT: Routine cleaning is necessary because mildew or algae can grow in dirt and debris on the membrane surface.

Periodic cleaning with mild liquid dish soap, water and a soft-bristled scrub brush, followed by thorough rinsing, will help keep the DeckRite membrane looking new.
